"Introducing random point mutations into nucleic acods -

by prepn of single stranded template, annealing a primer, elongation,

misincorporation, completion of molecules and screening.

Bisclosure; p; English.

Random point mutations were introduced into the alpha fragment of

E.coll beta galactosidase. The wild type sequence was obtained as a

Single stranded template and an oligonucleotide was hybridised to

it to generate a popn of DNA molecules which terminate at all

possible nucleotide positions within a specified region. The

variable 3' ends generated in this way are used as primers for

reverse transcriptase. Nucleotides are misincorporated by the

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins PT comprising a binding domain and an effector domain bisclosure; Page 35; 255pp; English.

Disclosure; Page 35; 255pp; English.

Comprising a binding domain and an effector domain bisclosure; Page 35; 255pp; English.

Cofficial a generic DNA Sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)1(TGC)(NNB)10(TGC)2(NNB)4Z(NNB)8(TGC)(NNB) CCC Synthetic Affinity Reagents. Other generic sequences are shown in R65151-54. TSARS are concatenated heterofunctional proteins or peptides. Comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also contained so that the expressed peptide contains 2 or 4 cysteine residues confer some degree of conformational rigidity to the peptides. They can also replace to the functional rigidity to the peptides. The TSARS or comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal contains a liso replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production.

Complex methods of hybridoma formation or in vivo antibody production.

Complex methods of hybridoma formation or in vivo antibody production.

Complex methods of hybridoma formation or in vivo antibody production.

Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins PT comprising a binding domain and an effector domain bisclosure; Page 35; 255pp; English.

Disclosure; Page 35; 255pp; English.

CO 70468 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)1(TGC)(NNB)6Z(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are contracted for these generic sequences are shown in CR5151-34. TSARS are concatenated by these generic sequences are shown in a fifthity for a ligand and a second effector peptide portion that is comprising at least two functional regions - a binding domain with a fifthity for a ligand and a second effector peptide portion that is chanically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues so that the expressed peptide contains 2 or 4 cysteine residues so confer some degree of conformational rigidity to the peptides. The TSARs or comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, caling and an also replace the function of macromolecules, eg. ... encoded the conformation of macromolecules, eg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 0 A; 2 C; 2 G;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1542 CITGGTGTTCCTGAGGAAGCGGCGTTCGTTGTGCCTGGAGCCCCAGAGGCCTGGGGGCAC 1483

Generic DNA sequence to generate a random TSAR petide library.
TSAR, totally synthetic affinity reagent, synthetic; binding domain;
effector domain; concateneated heterofunctional protein; linker;
direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= a

The present sequence is an antisense oligonucleotide specific for the human endothelin-1 targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis,

Throducing random point mutations into nucleic acods -
Introducing random point mutations into nucleic acods -
Introducing random point mutations into nucleic acods -
Introducing random point mutations are misincorporation, completion of molecules and screening.

Disclosure; p: English.

Random point mutations were introduced into the alpha fragment of
E.coli beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to
it to generate a popn of DNA molecules within the specified region. The possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for variable 3' ends generated in this way are used by the transcriptase and the molecules are completed to forms that can be maplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which cocurred singularly in any given mutant.
                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins or comprising a binding domain and an effector domain proteins bisclosure; Page 36; 255pp; English.

Disclosure; Page 36; 255pp; English.

Cy10470 is a generic DNA Sequence used to generate random TSAR (Totally Cy10470 is a generic DNA Sequence used to generic formula can also be represented as follows: X(NNB) 4(CAC)(NNB) 82(NNB) 8C(AC)(NNB) 8C(AC)(NNB) Y. X and Y are flanking restriction sites (X is not the same content generic sequences (Q70471-73) have invariant histidine residues other generic sequences (Q70471-73) have invariant histidine residues incorporated into variant sequences. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The TSARs or compens. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, and an a second and active to the proteins of macromolecules, eg. metal ion, and proteins of macromolecules, eg. metal ion, and an an active to the component of macromolecules, coll. They can also replace the function of macromolecules, eg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 5 A; 10 C; 0 G; 0 T:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Generic DNA sequence to generate a random TSAR petide library. TSAR; totally synthetic affinity reagent; synthetic; binding domain; effector domain; concateneated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.

contains 2 or 4 cystering residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compens. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid
This generic formula can be represented as follows: X(TGC)(NNB)10-
(TGC)(NNB)2(TGC)(NNB)14(TGC)Y. X and Y are flanking restriction
sites (X is not the same as Y) that are not specified further. This
sequence generates peptides that are clovesleaf in structure. Other
generic sequences are shown in Q70465-68. Other specific peptides
generated by these generic sequences are shown in R65150-54. TSARs are
concatenated heterofunctional proteins or peptides, comprising at least
two functional regions - a binding domain with affinity for a ligand and
a second effector peptide portion that is chemically or biologically
active. They may further comprise a linker peptide between the 2 domains.
The oligonucleotides are also designed so that the expressed peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 8.977; Variance 5.692; scale 1.577
